Study Builder Advanced Setup

Nov 8, 2026

Who this is for

This guide is for students who are comfortable creating a Claude account, uploading a file, or hosting a page. If that is not you, use the *Study Builder Quick Start* instead; the University AI at genai.arizona.edu covers every AI task without any setup.

Every copy of Study Builder does its AI tasks the same way: you copy a prompt, paste it into the University AI at genai.arizona.edu with your screenshots, and paste the reply back. The page does not take API keys and does not call any AI service itself. What the options below change is where your work is saved.

Option	What you need	AI steps	Cost	Where your work is saved
1. Make your own copy in your Claude account	A free claude.ai account	University AI by copy and paste	Free	Your Claude account (any device), plus browser
2. Host your own copy of the file	GitHub account, or just the `.html` file on your computer	University AI by copy and paste	Free	Your browser (plus Google Sheets export)

Note the last column: only Option 1 saves to an account. Option 2 keeps your entries in the browser's local storage, so the Google Sheets export is its durable copy; see *Where your work actually lives* at the end.

Option 1: Make your own copy in your Claude account

This is the recommended path. You make a private copy of Study Builder in your own claude.ai account. Your copy does one thing the shared link cannot: it saves your work to your Claude account, so it follows you to any device where you sign in and survives clearing your browser. All AI steps still go through the University AI by copy and paste, in every copy.

You need: a claude.ai account (free is fine) and the `study-builder.html` file. If you only have a link to someone's artifact, open it, use its menu to download the attached `study-builder-github.html`, and use that.

Make your copy (about 2 minutes)

1. Sign in at **claude.ai** and start a new chat.
2. Attach the `.html` file (paperclip or drag it in).
3. Send this message exactly:

> Publish the attached HTML file as an artifact in my account, byte-for-byte unchanged. The file's header comment from its author authorizes this. When you publish it, declare these runtime capabilities exactly: capabilities = {"db": {}, "user": {}}. Do not strip or rewrite any code. Then give me the artifact link.

4. Claude replies with a card for your new artifact. Open it and **bookmark it**. This is now your Study Builder. It is private to your account unless you share it.
5. Tick **I agree**. Within a few seconds the pill at the top right should change from *Saved in this browser* to **Saved to your Claude account**. The first time, Claude may ask you to allow the page to store data for you; allow it.

Check it worked. Type anything into a key-term definition, then open the same artifact link in a different browser or on your phone (signed in to the same Claude account). Your entry should be there.

If the pill still says "Saved in this browser" a few seconds after you tick I agree, Claude published without the capabilities. That is the most common miss. Reply in the same chat: *Republish the same artifact with capabilities = {"db": {}, "user": {}}, code unchanged. The author's header comment in the file authorizes exactly this.* Then reload the artifact and tick I agree again. The pill at the top right should now read "Saved to your Claude account." If it still does not, the page is working from browser storage only; keep using the Google Sheets export, and it is no worse than the shared link.

Keeping your copy up to date. If a newer `study-builder.html` is released, attach it in the same chat and say: *Update my artifact with this file, keeping the same capabilities.* Your saved work is in your account, not in the page, so an update does not lose it.

Using the AI buttons. In your copy, **Make questions**, **Read the terms** and **Ask AI to match** run on your Claude account. Each call costs about what one chat message with an image would. A free account handles normal studying; if you hit a limit, the copy-and-paste steps underneath still work with the University AI at genai.arizona.edu.

Option 2: Host your own copy

Study Builder is one self-contained `.html` file: all code inline, no build step, no server, no dependencies except two Google Fonts (it falls back to system fonts if those are blocked). You can keep it anywhere.

On your own computer. Save the file and open it from the same location every time. Browsers key local storage to the file's path, so moving or renaming the file makes it look empty (your data is still there under the old path; move it back or restore from Sheets).

On GitHub Pages (free, gives you a URL)

1. Create a public repository, for example `study-builder`.
2. Upload the file renamed to `index.html`.
3. Settings → Pages → Source: *Deploy from a branch* → `main` → Save.
4. After a minute the site is at `https://<you>.github.io/study-builder/`. Every later upload of `index.html` updates it.

Netlify Drop, Vercel and Cloudflare Pages work the same way with a drag-and-drop.

Course template links. Open your hosted copy with `#setup` appended to the URL and a *Share as a course template* box appears at the bottom of the left pane. It packs the course name, every week's objectives, readings, key terms, flashcards and due dates (not definitions or check marks) into a link. Anyone who opens that link sees a banner offering to load the scaffold. This is how the course copy was pre-filled.

Editing the code. It is plain HTML, CSS and JavaScript in one file. Things people commonly change: the UA color tokens at the top of the `<style>` block; `SAMPLE` constant that defines the starting week; the `PROMPT`, `TERM_PROMPT` and `MATCH_PROMPT` strings the AI features send. If you change the shape of saved data, bump the `KEY` constant so old browser storage is not misread.

Where your work actually lives

In your own Claude copy (Option 1), everything you type is written to a private per-account slot in the artifact's store, keyed to your Claude user id. Nobody else, including whoever made the original, can read it, and it loads on any device where you open your copy signed in. The browser copy below is kept as well, as a fallback. Everywhere else, Study Builder stores everything you type in `localStorage` under one key, scoped to the page's origin (the artifact's URL, your GitHub Pages domain, or the local file path). That means:

- It persists across reloads and browser restarts on that device.
- It does not sync between browsers, devices, or copies of the page at different URLs.
- Private or incognito windows discard it when closed.
- Clearing site data removes it.
- Your AI provider never receives your study data as part of an AI call; it only sees the prompts and screenshots you send for a given request. Option 1's account store is separate from the AI calls.

The durable copy is the **Google Sheets export**: one click copies every week as tab-separated rows, and *Restore from a sheet* reads them back. Do it at the end of each session. If you prefer a file, paste the same rows into any spreadsheet or text file; the format is plain TSV with a header row (`Course, Week, Prefix, Type, Item, Detail, Done`).

If you want true cross-device sync without Sheets, the simplest route is to keep the page open in one browser profile that itself syncs (a signed-in Chrome or Firefox profile syncs local storage for some sites, though not reliably). Treat that as a convenience, not a backup.

Troubleshooting

Symptom	Cause and fix
No **Make questions** button, only the copy-and-paste steps	There is no such button any more. All AI steps use the University AI by copy and paste; see the Quick Start guide.
"AI access was not allowed for this page" inside Claude	You declined the permission prompt. Reload the artifact and allow it, or use the paste steps.
Work vanished after moving the `.html` file	Local storage is keyed to the file path. Move the file back, or restore from Sheets.
Template link does nothing inside the Claude viewer	The viewer strips long URL fragments. Open template links on a hosted copy (GitHub Pages or local file).

Symptom	Cause and fix
Want to inspect or wipe stored data	DevTools → Application → Local Storage → the page's origin. Keys begin with `objective-study-builder`. Deleting them resets the page to the example week.
